SUMMARY

NOC and Automation Specialist with 6 years of experience building and operating systems in a Managed Service Provider environment. Focused on designing web applications, APIs, automation workflows, and infrastructure tooling end-to-end. Experienced with PowerShell, Rewst API workflows, NinjaOne RMM, ConnectWise PSA, and Microsoft Azure. Currently pursuing a B.S. in Software Engineering at WGU with a focus on full-stack development and DevOps engineering.

CORE SKILLS

Software Development: C#, ASP.NET Core, TypeScript, React, JavaScript, Python, REST API Design, SQL, Java

NOC & Infrastructure: Alert Triage, Incident Response, Server/Network Troubleshooting, Root Cause Analysis, Escalation Support

Cloud & DevOps: Microsoft Azure (AZ-900), Entra ID, Microsoft 365, Exchange Online, Windows Server, Linux, Git, GitHub

Automation & Scripting: PowerShell 7+, Rewst API, Python, Bash, SQL

Tools & Platforms: NinjaOne RMM, ConnectWise PSA, Acronis, Postman, VS Code, Microsoft 365 Admin, MongoDB

PROFESSIONAL EXPERIENCE

NOC Technician / Automation | iPower Technologies — *MSP Environment*

- Monitor and triage infrastructure alerts across multi-client environments using NinjaOne RMM, with focus on server health, network connectivity, and backup failures.
- Build and maintain PowerShell automation workflows for recurring remediation tasks including SFC/DISM repairs, disk cleanup, printer spooler resets, and network diagnostics, reducing manual intervention time.
- Develop and refine Rewst API-driven automation workflows to streamline alert response, ticket routing, and client-specific remediation sequences.
- Manage Acronis backup monitoring, alert response, and recovery workflows across client server environments.
- Administer Microsoft 365 and Exchange Online environments: mailbox provisioning, mail flow diagnostics, message tracing, and retention policy troubleshooting.
- Manage identity and authentication workflows involving Active Directory, Entra ID, MFA configuration, and login troubleshooting across enterprise client accounts.
- Produce structured documentation of troubleshooting timelines, diagnostics, and resolutions to improve escalation quality and build repeatable support workflows.
- Collaborate with engineering and infrastructure teams during escalations and service-impacting incidents across client networks.

Software Engineer | Freelance / Personal Projects

- Built and deployed full-stack web applications using React, TypeScript, Tailwind CSS, and SQL, with a focus on clean component architecture and responsive UI.
- Designed and consumed REST APIs for application integration, applying structured request/response patterns and error handling across multiple projects.
- Applied object-oriented design principles, debugging, logging, and structured problem-solving to build reliable, maintainable applications.

AUTOMATION & ENGINEERING PROJECTS

Alert Trend Automation — NOC Workflow

- Designed and built automation workflows using Rewst API and PowerShell to identify recurring alert patterns across client environments and trigger targeted remediation sequences.
- Reduced alert-to-resolution time for common recurring issues by automating ticket creation, diagnostics, and remediation steps end-to-end.

PowerShell System Repair & Automation Toolkit

- Engineered a modular PowerShell toolkit performing automated system health checks, disk cleanup, printer spooler resets, and network repair workflows.
- Implemented structured logging and ticket-ready output designed for enterprise MSP environments.

Exchange Online & Identity Troubleshooting Workflows

- Designed repeatable diagnostic workflows for Microsoft 365 mail flow issues, mailbox recovery, and Entra ID authentication failures.
- Documented investigation steps and resolution paths for escalation efficiency and team knowledge sharing.

Enterprise level Disk Cleanup Workflow

- Built and iterated a multi-stage automated disk remediation system for a managed services NOC environment, integrating NinjaOne RMM triggers with PowerShell scripts to detect, clean, and re-evaluate low disk space across managed endpoints.
- The solution targets high-volume alert noise by autonomously resolving common disk issues including temp file removal, orphaned profile cleanup, and WU cache purging escalating to a ticketing workflow only when remediation is insufficient.

CERTIFICATIONS

- Microsoft Azure Fundamentals (AZ-900)
- NinjaOne Certified Automation Specialist
- ConnectWise PSA Help Desk Certification
- Python Data Analytics & Data Structures Certification
- AWS Certified Cloud Practitioner (*Planned*)
- ITIL Foundation Certification (*Planned*)

EDUCATION

B.S. Software Engineering — Western Governors University
Software Engineering — C# Track

Expected 2027–2028

High School Diploma — Florida Virtual School (FLVS)

2023
